NEW QUESTION: 3

In the days before CIDR (Classless Internet Domain Routing), networks were commonly organized by classes. Which of the following would have been true of a Class B network?

- A. The first two bits of the IP address would be set to one, and the third bit set to zero.
- B. The first three bits of the IP address would be set to one.
- C. The first bit of the IP address would be set to zero.
- D. The first bit of the IP address would be set to one and the second bit set to zero.

Answer: A

Explanation:

Each Class B network address has a 16-bit network prefix, with the two highest order bits set to 1-0.

The following answers are incorrect:

The first bit of the IP address would be set to zero. Is incorrect because, this would be a Class A network address.

The first two bits of the IP address would be set to one, and the third bit set to zero. Is incorrect because, this would be a Class C network address.

The first three bits of the IP address would be set to one. Is incorrect because, this is a distractor. Class D & E have the first three bits set to 1. Class D the 4th bit is 0 and for Class E the 4th bit to 1.

Classless Internet Domain Routing (CIDR) High Order bits are shown in bold below.

For Class A, the addresses are 0.0.0.0 - 127.255.255.255 The lowest Class A address is represented in binary as 00000000.00000000.00000000.00000000

For Class B networks, the addresses are 128.0.0.0 - 191.255.255.255. The lowest Class B address is represented in binary as 10000000.00000000.00000000.00000000

For Class C, the addresses are 192.0.0.0 - 223.255.255.255 The lowest Class C address is represented in binary as 11000000.00000000.00000000.00000000

For Class D, the addresses are 224.0.0.0 - 239.255.255.255 (Multicast) The lowest Class D address is represented in binary as 11100000.00000000.00000000.00000000

For Class E, the addresses are 240.0.0.0 - 255.255.255.255 (Reserved for future usage) The lowest Class E address is represented in binary as 11110000.00000000.00000000.00000000
