NEW QUESTION: 1
Scenario: A Citrix Architect needs to design an environment with optimal resource allocation for a large company. The company requires a highly available StoreFront design for 40,000 users. Each logs on once per hour, and the average user has 50 resources available. The company only has one datacenter.

The architect should recommend configuring a minimum of_____StoreFront servers, each with_____vCPUs and _____GB of RAM when all the connections are through Citrix Receiver for Web. (Choose the correct option to complete the sentence.)

A. 2; 4; 4
B. 2; 4; 6
C. 4; 2; 2
D. 4; 2; 4

Answer: B

Explanation:

The throughput of a single StoreFront server can also be increased by assigning more virtual CPUs to the system, with four virtual CPUs enabling up to 55,000 user connections per hour and eight virtual CPUs enabling 80,000 connections per hour.

The minimum recommended memory allocation for each server is 4GB. When using Citrix Receiver for Web, assign an additional 700 bytes per resource, per user in addition to the base memory allocation. As with using Citrix Receiver for Web, when using Citrix Workspace app, design environments to allow an extra 700 bytes per resource, per user on top of the base 4 GB memory requirements for this version of StoreFront.

- Note that Receiver for Web users will consume more RAM on average than native Receiver users.
- Minimum of 4 GB of RAM is recommended per StoreFront server in all cases as a baseline
- Additionally, more sites/farms enumerated per store will increase both CPU utilization and server response time.
