NEW QUESTION: 1

Your network consists of one Active Directory domain. The domain contains servers that run Windows Server 2008. The relevant servers are configured as shown in the following table:

Your company has a department named Sales.

All users in the Sales department have desktop computers that run Windows Vista Enterprise Edition.

All users in the Sales department run an application named Application1 that is compatible only with Windows 95.

To run Application1, each user in the Sales department has a second desktop computer that runs Windows 95.

The Windows 95 computers must be removed from the network.

You use the Microsoft Application Compatibility Toolkit (ACT) 5.0 to test Application1. The test confirms that the application runs only on Windows 95 computers and must be redeveloped to be compatible with Windows Vista or Windows Server 2008.

You need to recommend a solution that will enable you to remove the Windows 95 computers. Users in the Sales department must be able to continue running Application1.

What should you do?

A. Create and link a Group Policy object (GPO) that publishes

Application1 to all client computers in the Sales department. Configure Application1 to run as an administrator.

B. Install Application1 on Server2. Configure Application1 to run in compatibility mode for Windows 95. Configure all computers in the Sales department to run the application through Terminal Services.

C. Create a virtual machine that runs Windows 95 and Application1. Run the virtual machine on all computers in the Sales department by using Microsoft Virtual PC 2007.

D. Create and link a Group Policy object (GPO) that assigns Application1 to all client computers in the Sales department. Configure Application1 to run in compatibility mode for Windows 2000.
