NEW QUESTION: 2
Which three statements about IS-IS are true? (Choose three.)
A. IS-IS can be used to route both IP and CLNP.
B. IS-IS can be used only in the service provider network.
C. IS-IS is an IETF standard.
D. IS-IS has the capability to provide address summarization
between areas.
E. IS-IS has three different levels of authentication:
interface level, process level, and domain level.
Answer: A,D,E
Explanation:
Intermediate System to Intermediate System (IS-IS) was designed
as the routing protocol for ISO's CLNP described in IS0 10589.
IS-IS is a Link State routing protocol akin to OSPF and was
developed by DEC for use with DECnet Phase V.
It was originally thought that TCP/IP would gradually make way
for the seven layer OSI architecture so an enhancement to IS-IS
was developed called Integrated IS-IS also known as Dual IS-IS
that could route both Connectionless
Mode Network Service (CLNS) as well as IP.
Cisco IOS supports IS-IS authentication on 3 different levels;
between neighbors, area-wide, and
domain-wide, where each can be used by themselves or together.
summary-address address mask {level-1 | level-1-2 | level-2} is
used to configure IP address
summarization.

NEW QUESTION: 3
You need to use Azure Automation State Configuration to manage the ongoing consistency of virtual machine configurations. Which five actions should you perform in sequence? To answer, move the appropriate action from the list of actions to the answer area and arrange them in the correct order.
NOTE: More than one order of answer choices is correct. You will receive credit for any of the correct orders you select.

Answer:
Explanation:

Explanation

Step 1: Upload a configuration to Azure Automation State Configuration.
Import the configuration into the Automation account.
Step 2: Compile a configuration into a node configuration.
A DSC configuration defining that state must be compiled into one or more node configurations (MOF document), and placed on the Automation DSC Pull Server.
Step 3: Onboard the virtual machines to Azure Automation State Configuration.
Onboard the Azure VM for management with Azure Automation State Configuration Step 4: Assign the node configuration Step 5: Check the compliance status of the node Each time Azure Automation State Configuration performs a consistency check on a managed node, the node sends a status report back to the pull server. You can view these reports on the page for that node.
On the blade for an individual report, you can see the following status information for the corresponding consistency check:
The report status - whether the node is "Compliant", the configuration "Failed", or the node is "Not Compliant"
