The cost (also called metric) of an interface in OSPF is an indication of the overhead required to send packets across a certain interface. The cost of an interface is inversely proportional to the bandwidth of that interface. A higher bandwidth indicates a lower cost. There is more overhead (higher cost) and time delays involved in crossing a 56k serial line than crossing a 10M ethernet line. The formula used to calculate the cost is:

$\text{cost} = 100000000 / \text{bandwidth in bps}$

For example, it will cost  $10^8 / 10^7 = 10$  to cross a 10M Ethernet line and will cost  $10^8 / 1544000 = 64$  to cross a T1 line.

By default, the cost of an interface is calculated based on the bandwidth; you can force the cost of an interface with the `ip ospf cost <value>` interface subconfiguration mode command.

### NEW QUESTION: 3

The Security team believes that a former employee may have gained unauthorized access to AWS resources sometime in the past 3 months by using an identified access key.

What approach would enable the Security team to find out what the former employee may have done within AWS?

- A. Use the Amazon CloudWatch Logs console to filter CloudTrail data by user.
- B. Use the AWS CloudTrail console to search for user activity.
- C. Use AWS Config to see what actions were taken by the user.
- D. Use Amazon Athena to query CloudTrail logs stored in Amazon S3.

**Answer: B**

Explanation:

You can use CloudTrail to search event history for the last 90 days. You can use CloudWatch queries to search API history beyond the last 90 days. You can use Athena to query CloudTrail logs over the last 90 days.
