NEW QUESTION: 3

Fuzz testing or fuzzing is a software/application testing technique used to discover coding errors and security loopholes in software, operating systems, or networks by inputting massive amounts of random data, called fuzz, to the system in an attempt to make it crash.

Fuzzers work best for problems that can cause a program to crash, such as buffer overflow, cross-site scripting, denial of service attacks, format bugs, and SQL injection.

Fuzzer helps to generate and submit a large number of inputs supplied to the application for testing it against the inputs. This will help us to identify the SQL inputs that generate malicious output.

Suppose a pen tester knows the underlying structure of the database used by the application (i.e., name, number of columns, etc.) that she is testing.

Which of the following fuzz testing she will perform where she can supply specific data to the application to discover vulnerabilities?

- A. Clever Fuzz Testing
- B. Complete Fuzz Testing
- C. Dumb Fuzz Testing
- D. Smart Fuzz Testing
