Which database configuration option allows a database instance to be deployed across multiple Availability Zones in a single Region?

- A. DB Parameter Groups
- B. Read Replicas
- C. Database Snapshots
- D. Multi-AZ DB Instance deployment

**Answer: B**

This helps to improve the performance of the source instance and provides a backup of the data in case of a failure. Read replicas are also used to create a standby database instance in a different Availability Zone, which can be promoted to a primary instance in the event of a failure of the primary instance.
