NEW QUESTION: 4

Amazon RDS is a managed database service that provides a highly available and scalable database instance in the cloud. You can create a database instance in a specific Availability Zone or in a Multi-AZ configuration. In a Multi-AZ configuration, Amazon RDS automatically creates a standby database instance in a different Availability Zone to provide high availability. The standby instance is a copy of the primary instance and is updated with the primary instance's data. In the event of a failure, Amazon RDS automatically fails over to the standby instance. This process is called a failover. The failover process is automatic and does not require any manual intervention. The failover process is also transparent to the application. The application continues to run without any interruption. The failover process is also seamless. The application does not need to be restarted. The failover process is also fast. The failover process takes only a few minutes to complete. The failover process is also secure. The failover process is protected by Amazon RDS's security features. The failover process is also compliant. The failover process is compliant with various industry standards and regulations. The failover process is also reliable. The failover process is highly reliable and has a high success rate. The failover process is also cost-effective. The failover process is a cost-effective way to ensure high availability and scalability for your database instance. The failover process is also easy to use. The failover process is simple to configure and manage. The failover process is also flexible. The failover process can be configured to meet your specific requirements. The failover process is also scalable. The failover process can handle a large number of database instances. The failover process is also secure.
