Which three options are best practices for implementing a DMVPN? (Choose three.)

- A. Deploy IPsec hardware acceleration to minimize router memory overhead.
- B. Configure SHA-1 for encryption of transported data.
- C. Configure QoS services only on the head-end router.
- D. Configure AES for encryption of transported data.
- E. Use IPsec in tunnel mode.
- F. Implement Dead Peer Detection to detect communication loss.

Answer: D,E,F

Best Practices Summary for Hub-and-Spoke Deployment Model

This section describes the best practices for a dual DMVPN cloud topology with the hub-and-spoke deployment, supporting IP multicast (IPmc) traffic including routing protocols.

The following are general best practices:

Use IPsec in transport mode

algorithms to certain countries may be prohibited by law).

Implement Dead Peer Detection (DPD) on the spokes to detect loss of communication between peers.

Deploy hardware-acceleration of IPsec to minimize router CPU overhead, to support traffic with low latency and jitter requirements, and for the highest performance for cost.

Keep IPsec packet fragmentation to a minimum on the customer network by setting MTU size or using Path MTU Discovery (PMTUD).

Use Digital Certificates/Public Key Infrastructure (PKI) for scalable tunnel authentication.

Configure a routing protocol (for example, EIGRP, BGP or OSPF) with route summarization for dynamic routing.

Set up QoS service policies as appropriate on headend and branch router interfaces to help alleviate interface congestion issues and to attempt to keep higher priority traffic from being dropped during times of congestion.

NEW QUESTION: 3

Refer to the exhibit. In this high-availability Cisco IM and Presence deployment with three subclusters, the first user is assigned to server 1A; the second user is assigned to server 2A; and the third user is assigned to server 3A. Assume that the Cisco IM and Presence is set to Active/Standby mode, to which server should the fourth user be assigned?

- A. 1B
- B. 3B
- C. 2A
- D. 3A
- E. 1A

Answer: E

Explanation:

This deployment model provides the same level of redundancy and high availability as outlined in the "Balanced Redundant High-Availability Deployment" section in this chapter. The only difference is that users are not deployed in a balanced fashion, but rather all reside on the primary server in the subcluster, and the backup server is there as a standby option if a node failure occurs.
