**NEW QUESTION:** 1A table named Profits stores the total profit made each year within a territory. The Profits table has columns named Territory, Year, and Profit.You need to create a report that displays the profits made by each territory for each year and its previous year.Which Transact-SQL query should you use?**A.** SELECT Territory, Year, Profit,LAG(Profit, 1, 0) OVER (PARTITION BY Territory ORDER BY Year) AS PrevProfit FROM Profits**B.** SELECT Territory, Year, Profit,LAG(Profit, 1, 0) OVER (PARTITION BY Year ORDER BY Territory) AS PrevProfit FROM Profits**C.** SELECT Territory, Year, Profit,LEAD(Profit, 1, 0) OVER (PARTITION BY Year ORDER BY Territory) AS PrevProfit FROM Profits**D.** SELECT Territory, Year, Profit,LEAD(Profit, 1, 0) OVER (PARTITION BY Territory ORDER BY Year) AS PrevProfit FROM Profits**Answer: A****Explanation:**Reference: <http://msdn.microsoft.com/en-us/library/hh231256.aspx>Reference: <http://msdn.microsoft.com/en-us/libra>

**NEW QUESTION: 2** Drag and drop the LISP components from the left onto the function they perform on the right. Not all options are used. **Answer:** Explanation: Explanation+ accepts LISP encapsulated map requests: LISP map resolver+ learns of EID prefix mapping entries from an ETR: LISP map server+ receives traffic from LISP sites and sends it to non-LISP sites: LISP proxy ETR+ receives packets from site-facing interfaces: LISP ITR Explanation ITR is the function that maps the destination EID to a destination RLOC and then encapsulates the original packet with an additional header that has the source IP address of the ITR RLOC and the destination IP address of the RLOC of an Egress Tunnel Router (ETR). After the encapsulation, the original packet become a LISP packet. ETR is the function that receives LISP encapsulated packets, decapsulates them and forwards to its local EIDs. This function also requires EID-to-RLOC mappings so we need to point out an "map-server" IP address and the key (password) for authentication. A LISP proxy ETR (PETR) implements ETR functions on behalf of non-LISP sites. A PETR is typically used when a LISP site needs to send traffic to non-LISP sites but the LISP site is connected through a service provider that does not accept no routable EIDs as packet sources. PETRs act just like ETRs but for EIDs that send traffic to destinations at non-LISP sites. Map Server (MS) processes the registration of authentication keys and EID-to-RLOC mappings. ETRs sends periodic Map-Register messages to all its configured Map Servers. Map Resolver (MR): a LISP component which accepts LISP Encapsulated Map Requests, typically from an ITR, quickly determines whether or not the destination IP address is part of the EID namespace

**NEW QUESTION: 3** Which parameter is required on MCU for ad hoc conferencing? **A.** Media Port reservation **B.** DSP reservation for video **C.** MCU Conference Bridge SIP Port **D.** MCU type **E.** incoming calls to unknown conferences or auto-attendants **Answer: A**

 Configure the Application Load Balancer to send the request to both servers Return each document from the correct server **B.**

Copy the data from both EBS volumes to Amazon EFS Modify the application to save new documents to Amazon EFS. Copy the data so both EBS volumes contain all the documents. Configure the Application Load Balancer to direct a user to the server with the documents.

**Answer:** **B**  
**Explanation:** <https://docs.aws.amazon.com/efs/latest/ug/how-it-works.html#how-it-works-ec2> Amazon EFS provides file storage in the AWS Cloud. With Amazon EFS, you can create a file system, mount the file system on an Amazon EC2 instance, and then read and write data to and from your file system. You can mount an Amazon EFS file system in your VPC, through the Network File System versions 4.0 and 4.1 (NFSv4) protocol. We recommend using a current generation Linux NFSv4.1 client, such as those found in the latest Amazon Linux, Redhat, and Ubuntu AMIs, in conjunction with the Amazon EFS Mount Helper. For instructions, see Using the amazon-efs-utils Tools. For a list of Amazon EC2 Linux Amazon Machine Images (AMIs) that support this protocol, see NFS Support. For some AMIs, you'll need to install an NFS client to mount your file system on your Amazon EC2 instance. For instructions, see Installing the NFS Client. You can access your Amazon EFS file system concurrently from multiple NFS clients, so applications that scale beyond a single connection can access a file system. Amazon EC2 instances running in multiple Availability Zones within the same AWS Region can access the file system, so that many users can access and share a common data source. How Amazon EFS Works with Amazon EC2 <https://docs.aws.amazon.com/efs/latest/ug/how-it-works.html#how-it-works-ec2>
