NEW QUESTION: 2Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct

solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen. You use Azure Security Center for the centralized policy management of three Azure subscriptions. You use several policy definitions to manage the security of the subscriptions. You need to deploy the policy definitions as a group to all three subscriptions. Solution: You create a resource graph and an assignment that is scoped to a management group. Does this meet the goal? **A. Yes** **B. No** **Answer: B** **Explanation:** **Explanation** **References:** <https://docs.microsoft.com/en-us/azure/governance/management-groups/create>

NEW QUESTION: 3 Which of the following security architectures defines how to integrate widely disparate applications for a world that is Web-based and uses multiple implementation platforms? **A. Service-oriented architecture** **B. Sherwood Applied Business Security Architecture** **C. Service-oriented modeling and architecture** **D. Enterprise architecture** **Answer: A** **Explanation:** **Explanation/Reference:** **Explanation:** In computing, a service-oriented architecture (SOA) is a flexible set of design principles used during the phases of systems development and integration. A deployed SOA-based architecture will provide a loosely-integrated suite of services that can be used within multiple business domains. SOA also generally provides a way for consumers of services, such as web-based applications, to be aware of available SOA-based services. For example, several disparate departments within a company may develop and deploy SOA services in different implementation languages; their respective clients will benefit from a well understood, well defined interface to access them. XML is commonly used for interfacing with SOA services, though this is not required. SOA defines how to integrate widely disparate applications for a world that is Web-based and uses multiple implementation platforms. Rather than defining an API, SOA defines the interface in terms of protocols and functionality. An endpoint is the entry point for such an SOA implementation. (Layer interaction in Service-oriented architecture) **Answer A** is incorrect. SABSA (Sherwood Applied Business Security Architecture) is a framework and methodology for Enterprise Security Architecture and Service Management. SABSA is a model and a methodology for developing risk-driven enterprise information security architectures and for delivering security infrastructure solutions that support critical business initiatives. The primary characteristic of the SABSA model is that everything must be derived from an analysis of the business requirements for security, especially those in which security has an enabling function through which new business opportunities can be developed and exploited. **Answer D** is incorrect. The service-oriented modeling and architecture (SOMA) includes an analysis and design method that extends traditional object-oriented and component-based analysis and

design methods to include concerns relevant to and supporting SOA. AnswerB is incorrect. Enterprise architecture describes the terminology, the composition of subsystems, and their relationships with the external environment, and the guiding principles for the design and evolution of an enterprise.
